(54) APPARATUS FOR CORRECTING DATA ERROR USING CHANNEL STATE INFORMATION

(57)Abstract:

PROBLEM TO BE SOLVED: To provide an apparatus for correcting data errors which is improved in decoding performance to original signals.

SOLUTION: A soft decision block for adding a weighted value relating to a channel state information to I and Q symbols, on which soft decision is made, conducts soft decision of the I and Q symbols and adds the weighted value of the channel state information to the I and Q symbols. A bit interleaver interleaves the data bit by bits corresponding to the I and Q symbols, to which soft decision is made so that the signal processing load on the bit interleaver conducting interleaving is reduced. Thus, the decoding performance of a trellis decoder correcting data errors and decoding the data to the original signals is improved.

LEGAL STATUS

[Date of request for examination]

29.01.2003

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]

[Date of final disposal for application]

[Patent number]

[Date of registration]

[Number of appeal against examiner's decision
of rejection]

[Date of requesting appeal against examiner's
decision of rejection]
